[Php For Mac Os](#)

On my case I have a folder called "Development" in my Home folder that has all the development projects organized in there.

ini as you feel fit Configure Apache web serverIf you have the default Apache installation (and I assume you do) then you find your httpd.. Now edit the httpd conf file using root access with the sudo command and your favorite text editor.. Enable PHP5 moduleSearch for the PHP module (/php5 Then it would be good idea to remove the comment from the following line in order to enable PHP to run with Apache: # LoadModule php5_module.. conf under /private/etc/apache2/httpd conf I expect that you have the technical ability of a software developer familiar with Linux commands.

Once that's done we're free to go ahead and configure setup PHP and configure Apache.. Lets setup PHP firstIn order to do so copy php ini default to php ini cp /private/etc/php.. Please note that PHP is not by default turned on in Snow Leopard To make sure that you're configuring everything correctly it's best to make Web Sharing active (System Preferences » Sharing » Web Sharing).. I personally prefer vim if I need to get something done on Terminal but you can also use TextMate or any other text editor.. It was primarily written to help with spoofing for wireless security audits Share improve this answer follow answered Nov 5 '13 at 11:17. [Dell Latitude E6400 Smart Card Reader Driver For Mac](#)

 If you know what you're doing and need any special stuff then go ahead and modify the php.. Fortunately Snow Leopard comes with the latest PHP version (version 5 3 0 at the time of this post) so that's covered.. This is a PHP class for MAC address manipulation on top of Unix, Linux and Mac OS X operating systems.. It should look something like that in your httpd conf: LoadModule rewrite_module libexec/apache2/mod_rewrite.. The line should look like that after you're done: LoadModule php5_module Enable mod_rewrite for permalinksIf you like beautiful URLs (permalinks) then make sure that you have mod_rewrite Apache module enabled. So in this case it's also good idea to run Apache under your own user in development environment (which your Snow Leopard installation most probably is).. ini default /private/etc/php ini This way we'll keep the original php ini default just in the right place for any future reference.. Now it's time to continue with setting up Apache and PHP If you're coming here through search engine then you probably want to check our previous posts on [intlink id="how-to-create-a-wordpress-development-environment-on-mac-os-x-snow-leopard" type="post"]how to install and configure WordPress on Mac OS X Snow Leopard[/intlink].. PHP is a server-side, cross-platform, HTML embedded scripting language OS X El Capitan OS X Yosemite OS X Mavericks OS X Mountain Lion Download.. soChange the user Apache runs asI prefer not to use Mac OS X Snow Leopards default location for sites (the Sites folder in your Home folder). 34bbb28f04 [Animated Wallpapers And Widgets For Mac](#)
